IN SIMPLY CONNECTED COTANGENT BUNDLES, EXACT LAGRANGIAN COBORDISMS ARE H-COBORDISMS

HIRO LEE TANAKA

Abstract. We show that if Q is simply connected, then every exact Lagrangian cobordism between compact, exact Lagrangians in the cotangent bundle of Q is an h-cobordism. The result follows as a corollary of the Abouzaid-Kragh theorem.

1. Introduction

We prove:

Theorem 1. Let Q be simply connected and smooth. Any compact exact Lagrangian cobordism between compact, exact Lagrangians in T^*Q is an h-cobordism.

By the h-cobordism theorem [Sma62, Mil65], we have:

Corollary 2. If Q is smooth, simply connected, and has $\dim Q \geq 5$, any two compact, exact Lagrangians related by an exact compact cobordism are diffeomorphic.

This result is motivated by two topics of interest. The first is the Nearby Lagrangian Conjecture of Arnol'd [Arn86], which conjectures that if Q is a smooth, compact manifold (not necessarily simply connected), then any compact, exact Lagrangian in T^*Q is Hamiltonian-isotopic to the zero section. Theorem 1 shows that the classification of Lagrangian cobordism classes in T^*Q provides another strategy for attacking the conjecture when $\dim Q \geq 5$ and $\pi_1 Q = *$. Namely, if there is only one exact, compact cobordism class, then every compact exact Lagrangian is cobordant to the zero section by a cylinder. An unknotting theorem for cylindrical cobordisms in $T^*(Q \times \mathbb{R})$ would exhibit the cobordism as a Hamiltonian isotopy.

The second is recent work on categories of Lagrangian cobordisms, as developed in [NT11] and [BC13a, BC13b]. For a fixed symplectic manifold M satisfying certain monotonicity or convexity conditions, one can define a category whose objects are Lagrangians (equipped with standard Floer-theoretic decorations) and whose morphisms are Lagrangian cobordisms between them (equipped with compatible decorations). In the setting of [NT11], all objects and cobordisms are *exact*. The theorem shows one motivation for considering *non-compact* cobordisms in this category. (Otherwise, every morphism is homotopically uninteresting.)

Finally, there is another way in which Theorem 1 touches both topics. Recall:

Theorem 3 (Fukaya-Nadler-Seidel-Smith [Nad09, FSS08])**.** Let Q be smooth, compact, and simply connected. Any compact exact Lagrangian inside T^*Q is equivalent to Q in the Fukaya category of T^*Q, with $\mathbb{Z}/2\mathbb{Z}$ coefficients. If both Q and the Lagrangian are Spin, then the same is true over arbitrary coefficients.

Date: May 12, 2014.
Key words and phrases. Cobordisms, Fukaya Categories, Mirror Symmetry.

It can be shown that compact, exact Lagrangians related by a compact, exact cobordism are equivalent in the Fukaya category [Tan13, Tan]. [1] Hence the equivalence class of an object in $\mathsf{Fukaya}(T^*Q)$ is an invariant of an exact Lagrangian's cobordism class. If this is a complete invariant (in the way Stiefel-Whitney numbers classify unoriented cobordism classes) the above theorem of Fukaya-Nadler-Seidel-Smith, together with Theorem 1, would show that any two exact, compact Lagrangians are h-cobordant (to the zero section).

Remark 4. Finally, we are told that Lara-Simone Suarez has a result for non-simply-connected cobordisms [Sua]—specifically, that exact, spin, Lagrangian cobordisms for which the collar inclusions induce isomorphisms on π_1 are diffeomorphic to cylinders. Instead of relying on Abouzaid-Kragh's theorem, she utilizes a previous result of Biran and Cornea [BC13a]. This also allows her to consider symplectic manifolds that need not be cotangent bundles.

2. Recollections

Recall that T^*Q has a 1-form $\theta_Q = \sum_i p_i dq_i$ whose derivative is symplectic.

Definition 5. We say a Lagrangian submanifold $L \subset T^*Q$ is *exact* if it is equipped with a smooth function $f_L : L \to \mathbb{R}$ for which $df_L = \theta|_L$. We call f_L a primitive for L.

Definition 6. A Lagrangian submanifold $W \subset T^*Q \times T^*(0,1)$ is said to be a *Lagrangian cobordism* from L_0 to L_1 if

$$W|_{(0,\epsilon)} = L_0 \times (0,\epsilon) \qquad \text{and} \qquad W|_{(1-\epsilon,1)} = L_1 \times (1-\epsilon, 1) \subset M \times T^*(0,1).$$

Fixing primitives f_{L_i}, we say W is *exact* if one can choose a function $f_W : W \to \mathbb{R}$ so that

$$f_W|_{L_0 \times (0,\epsilon)} = f_{L_0} \qquad f_W|_{L_1 \times (1-\epsilon,1)} = f_{L_1}, \qquad df_W = (\theta_Q + \theta_{\mathbb{R}})|_W.$$

In particular, the value of f is independent of t when $t \in (0,\epsilon) \bigcup (1-\epsilon, 1)$.

Finally, recall the following:

Theorem 7 (Abouzaid-Kragh [Abo12, Kra13])**.** If $L \subset T^*Q$ is a compact, exact Lagrangian, then the projection map $L \to Q$ is a homotopy equivalence.

3. Proof

Given a (not necessarily Lagrangian) cobordism Z, let Z^{op} be the same cobordism with ingoing and outgoing boundaries interchanged. We call the composite $Z \circ Z^{\mathrm{op}}$ a *double* of Z. (The other double is the composition $Z^{\mathrm{op}} \circ Z$.)

Lemma 8. Let Q be simply connected. Then any compact, exact cobordism between two compact exact Lagrangians in T^*Q has a double which is an h-cobordism.

[1] Over arbitrary coefficients, one needs each Lagrangian to have a Spin structure, and for the cobordism to respect this structure. In characteristic 2, no such structure is needed.

Lemma 9. Let Y_0, Y_1 be simply connected manifolds. If Z is any smooth cobordism between them such that a double is an h-cobordism, then Z is an h-cobordism itself.

Proof of Theorem. By Abouzaid-Kragh, any two compact exact Lagrangians in T^*Q are homotopy equivalent to Q, so are simply connected. By the lemmas, any compact exact cobordism between them is an h-cobordism. □

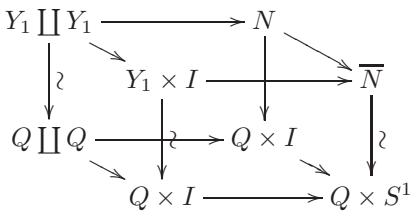
Proof of Lemma 8. Let $Y_{01} \subset T^*Q \times T^*(0,1)$ be a cobordism from Y_0 to Y_1, with each $Y_i \subset T^*Q$ compact and exact. Note that the diffeomorphism $\mathbb{R} \to \mathbb{R}$ given by $t \mapsto -t$ gives rise to another exact cobordism $Y_{01}^{\mathrm{op}} \subset M \times T^*(0,1)$, from Y_1 to Y_0. We prove that the composite cobordism

$$N = Y_{01} \circ (Y_{01})^{\mathrm{op}}$$

is an h-cobordism.

Note that since N is a cobordism collared by Y_1 on both ends, we can glue the Y_1 on both ends via the identity to obtain a compact, exact Lagrangian in $T^*(Q \times S^1)$. (We are guaranteed exactness since, by definition of cobordism, the primitive function f realizing $df = \theta_{Y_1}$ must agree along the collars). We call this Lagrangian $\overline{N}$.

By Abouzaid-Kragh, the projection map $\overline{N} \to Q \times S^1$ is a homotopy equivalence. Consider the diagram



where the top and bottom faces are pushout squares. (The all vertical arrows are projection maps to the zero section, and the indicated arrows are equivalences by Abouzaid-Kragh.) By excision and the Five Lemma, the remaining vertical arrow induces an isomorphism in homology $H_*(N) \to H_*(Q \times I)$.

Moreover, N has trivial fundamental group: the groupoid version of van Kampen's theorem shows there must be a pushout diagram of groupoids

$$\begin{array}{ccc} \Pi(Y_0 \coprod Y_0) \simeq * \coprod * & \longrightarrow & B\pi_1 N \\ \downarrow & & \downarrow \\ \Pi(Y_0 \times [-\epsilon, +\epsilon] \simeq * & \longrightarrow & \Pi(N) \cong B\mathbb{Z} \end{array}$$

whence it follows that $\mathbb{Z} \cong \mathbb{Z} * \pi_1 N$, hence $\pi_1 N \cong 0$. By the Whitehead and Hurewicz theorems, the projection map thus realizes a homotopy equivalence $N \simeq Q \times I$. Moreover, the inclusion of Y_1 on either collar of N fits into a commutative diagram of topological spaces

$$\begin{array}{ccc} Y_1 & \longrightarrow & N \\ \downarrow{\scriptstyle \pi} & & \downarrow{\scriptstyle \pi} \\ Q & \longrightarrow & Q \times [a, b]. \end{array}$$

The lefthand vertical arrow is a homotopy equivalence by the Abouzaid-Kragh theorem, as is the righthand vertical arrow from our previous discussion. The bottom horizontal arrow is obviously a homotopy equivalence, so the top horizontal arrow must be as well. This shows that N is in fact an h-cobordism from Y_1 to itself. □

Proof of Lemma 9. Note we have the inclusion $Y_0 \hookrightarrow Y_{01} \circ (Y_{01})^{\mathrm{op}}$. We make use of the pushout diagram

$$\begin{array}{ccc} Y_0 & \longrightarrow & Y_{01} \\ \downarrow & & \downarrow \\ Y_{01}^{\mathrm{op}} & \longrightarrow & Y_{01} \circ (Y_{01})^{\mathrm{op}}. \end{array}$$

Knowing that Y_0 is simply connected and that $Y_1 \simeq Y_{01}^{\mathrm{op}} \circ Y_{01}$ is simply connected, the Van Kampen theorem shows that Y_{01} is also simply connected. Finally, the Mayer-Vietoris sequence splits at each level by including $Y_1 \to Y_{01}$. Thus the Whitehead and Hurewicz theorems show that Y_{01} is an h-cobordism. □
